

Active Directory Rights Management Services (AD RMS)

Implementation Documentation

1. Introduction

This document describes the installation, configuration, and testing of **Active Directory Rights Management Services (AD RMS)** in the **mrt.com** Active Directory domain.

The objective of this implementation is to protect sensitive organizational data by enforcing **role-based access control** on documents stored in a shared location.

2. Environment Overview

Component	Details
Domain Name	mrt.com
Domain Controller (FQDN)	ad01.mrt.com
AD RMS Server Name	FS01
AD RMS Server IP Address	192.168.0.4/24
Server OS	Windows Server 2019
Client OS	Windows 10
Client Computer Name	C1

3. User Accounts Information

Username	Purpose
MRT\rmsadmin	AD RMS Service Account
MRT\rms1	RMS User – Full Access
MRT\rms2	RMS User – View Only

4. Prerequisites

- Active Directory Domain Services configured
- Domain Controller available at **ad.mrt.com**
- Active Directory Certificate Services (AD CS) installed
- Required domain user accounts created
- Network connectivity verified
- Windows Server 2019 updated

5. AD RMS Server Configuration Details

Item	Value
Server Name	FS01
Role Installed	Active Directory Rights Management Services
Database	Windows Internal Database (WID)
Certificate Authority	AD CS
Service Account	MRT\rmsadmin

6. AD RMS Installation

AD RMS was installed using **Server Manager** on Windows Server 2019.

Summary of Steps:

1. Logged into **FS01** as Domain Administrator.
2. Installed **Active Directory Rights Management Services** role.
3. Completed role installation successfully.
4. Launched the AD RMS Configuration Wizard.

7. AD RMS Configuration

The following configuration options were selected:

- New **AD RMS Root Cluster** created
- Database set to **Windows Internal Database**
- Service account configured as **MRT\rmsadmin**
- Certificates issued from **Active Directory Certificate Services**
- Service Connection Point (SCP) registered in Active Directory
- Cluster configured on server **FS01**

Configuration completed successfully.

8. Certificate Configuration

- AD RMS certificates were obtained from the internal **AD CS**
- Required certificate templates were enabled
- Certificate enrollment completed without issues

9. Shared Folder Configuration

Item	Details
Shared Folder Name	files1
Server	FS01
Network Path	\\FS01\files1
Purpose	Storage of RMS-protected documents

Notes:

- Folder permissions were configured to allow access for RMS users.
- RMS protection was applied at the document level, not at the share level.

10. Rights Policy Template Configuration

A custom **AD RMS Rights Policy Template** was created to enforce different access levels.

Template Name	ms
Template Type	AD RMS Rights Policy Template

User Rights Assignment:

User	Assigned Rights
rms1	Full Control (Read, Modify, Save, Print)
rms2	View Only (Read permission)

Template Behavior:

- **rms1** can fully access and modify protected documents.
- **rms2** can only view documents and cannot modify or redistribute them.

11. Client Configuration and Testing

Client Details:

- OS: Windows 10
- Computer Name: C1
- Domain Joined: mrt.com

Test Procedure:

1. Logged in as **rms1** on C1.

2. Accessed \\FS01\files1.
3. Created a document and applied the **ms** RMS policy.
4. Logged in as **rms2**.
5. Opened the same protected document.

Test Results:

- **rms1** had full access to the document.
- **rms2** was able to view the document only.
- Editing and saving were restricted for **rms2**.

12. Issues Faced and Resolution

Issue	Resolution
Remote Desktop was disabled on client PC	Enabled Remote Desktop manually on Windows 10 (C1)

No additional issues were encountered.

13. Security Considerations

- Role-based access enforced using RMS templates
- Least-privilege model applied
- Certificates issued from trusted internal CA
- Integration secured through Active Directory authentication

14. Conclusion

The AD RMS deployment in the **mrt.com** domain was successfully completed using **Windows Server 2019**.

The shared folder **files1** and the RMS rights policy template **ms** were configured to provide **full access for rms1** and **view-only access for rms2**.

This implementation ensures effective document protection and controlled information sharing within the organization.
